

<C Programming and Lab> Chapter 1 Getting Started with C Programming Lab Problems

※ Notes on the Problems

- In the output examples, □ denotes a blank space that is printed at the very beginning and at the very end of each line.
- In the input/output examples, the text that follows ↪ is an explanation of the corresponding input or output
- The sample submit function may be used on the OJ (Online Judge)

[Problem 1] Write a program that prints a rectangular shape composed of the digit 2, as shown below.

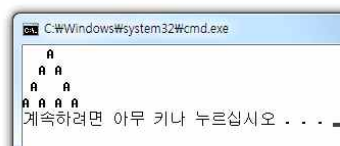

- The empty region in the middle should be printed in spaces.

Input Example 1	Output Example 1
	<pre> 222222 2 2 2 2 222222 </pre>

[Problem 2] Write a program that prints a triangular shape composed of the character A.

- Make appropriate use of space output so that a similar shape is printed.

Input Example 1	Output Example 1
	<pre> A A A A A A A A A </pre>

[Problem 3] Using scanf, read from the user one value among the digits 2 to 9, and print a rectangle composed of the value that has been read.

- In the input example, the integer is the value entered by the user.
-  denotes an [Enter] key press.

Input Example 1	Output Example 1
5↵	<pre> 555555 5 5 5 5 555555 </pre>

Input Example 2	Output Example 2
7↵	<pre> 777777 7 7 7 7 777777 </pre>

[Problem 4] Write a program that prints a birthday as shown below. (The birth date is fixed.)

Input Example 1	Output Example 1
	My birthday is month 3 date 5.

[Problem 5] Write a program that reads integers from the user, the month and the day corresponding to a birthday, and then produce the output as shown below.

- In the input examples, the integer is the value entered by the user.
-  denotes an [Enter] key press.

Input Example 1	Output Example 1
3 5	My birthday is month 3 date 5.

Input Example 2	Output Example 2
6 12	My birthday is month 6 date 12.

[Problem 6] Modify the previous problem so that the month and the day are read at the same time, and create a program that produces output as shown below.

- In the input examples, the two integers are the values entered by the user.
-  denotes an [Enter] key press.
- Write the program using the scanf only once.

Input Example 1	Output Example 1
3 5	My birthday is month 3 date 5.

Input Example 2	Output Example 2
11 2	My birthday is month 11 date 2.
